

WIRELESS IRRIGATION CONTROL

WHETHER YOU'RE GROWING GRASS OR CROPS, WE ALL KNOW WATER PLAYS A CRITICAL ROLE.

And getting water where you want it, when you want it, in just the right amounts is where we come in with the Loncel Smart Irrigation Controller.

Loncel IoT solutions can be configured for drip or sprinkler irrigation systems including Fixed-Grid, Flexi-Grid, K-Line™ and G-Set™.

The Loncel Irrigation Manager is a responsive web-app, which means no software to download, enabling remote control of your irrigation system with a high degree of flexibility, so you can schedule changes with the click of a mouse. With a Loncel radio driving each sprinkler valve, you can control hundreds of sprinklers from your smartphone, tablet or PC. Straightforward installation, simple operation and real time visibility provides the system operating parameters including irrigation quantities, soil moisture levels and fault identification by location.

K-Line™ and G-Set™ are registered trade marks of RX Plastics Ltd

"Irrigation initially helped us lift our production by about a third. The decision to move from relocatable irrigation lines to a grid system powered by a Loncel controller has shown us how efficient regular watering can be, without having to move irrigation lines a couple of times each day".

Corrigan Sowman, Uruwhenua Farms, Golden Bay.

Water is precious. The controller puts water exactly where it's needed in the right amounts to prevent over-watering.

By placing the right amount of water where it's needed, water run-off is minimised.

Saves time having to move relocatable irrigation lines. Real time visibility and simple operation.

Only uses the energy to pump the amount of water you require. Intelligent automation saves time and money.

The smart controller ensures the pumps will not exceed the maximum allowable 'water take' in any period. Historical reporting of application rates at your fingertips.

Straightforward, wireless installation and easy servicing with 'plug and play' replacement parts. 3 year battery life with early warning when replacements are due.

Reduces the frequency or removes entirely the need to manually relocate irrigation lines.

Can work around existing landscape and trees. Increases yield by controlling irrigation of land that boom irrigators cannot reach.

*Placing water precisely through the cloud.
Work smarter, not harder.*
